Licensed to bear the AMCA Seal for Sound and Air Performance

**USS81A
November2000**

U.S. FAN INTERNATIONAL® certifies that the USBI Series fans shown herein are licensed to bear the AMCA Seal. The ratings shown are based on tests and procedures performed in accordance with AMCA Publication 211 and AMCA Publication 311 and comply with the requirements of the AMCA Certified Ratings Program. For air performance data refer to catalog USC81.

INTRODUCTION

This catalog is a supplement to catalog USC81.

This catalog uses procedures in accordance with AMCA Standards. The sound power level ratings shown are in decibels, referred to 10^{-12} watts calculated per AMCA Standard 301. Values shown are for inlet (L_{wi}) sound power levels for installation type 'B', free in let, ducted outlet. Ratings do not include the effects of duct end correction.

In order to use this catalog the user must understand two concepts, that of specific sound power and VP/SP as follows:

Specific sound power is the means by which a fan's overall sound can be reduced to a set of base numbers which still represent the "signature" of the original fan. This is provided in the form of decibels produced from a fan delivering one CFM at one inch pressure over a frequency range of eight octave bands. In order to predict the sound of an other geometrically similar fan, the specific sound power level spectrum for that type of fan and its operating point location on the fan curve is found. The acoustic energy corresponding to the new fan is added back into the "base signature". This acoustic energy is called the "capacity fraction (L_{wf})". Therefore, the general equation is:

$$L_{wi} = L_{wki} + L_{wf}$$

Where:

- L_{wi} = Inlet sound power of fan
- L_{wki} = Inlet specific sound power for a particular fan design
- L_{wf} = Capacity fraction which is $10 \log (CFM) + 20 \log (\text{pressure})$

The specific sound power of a fan changes with operating point location on the fan curve. Therefore, a means must be devised to identify the specific sound power levels which correspond to the operating point for which sound is being desired. This is done using the term VP/SP in that regardless of speed, fan size or density, the VP/SP ratio remains constant and defines the same corresponding operating point for the base fan as well as the new fan.

The capacity fraction (L_{wf}) and VP/SP ratio can easily be found using Tables I and II. It is important to note that the VP/SP ratio requires both the VP and SP values to be at the same density. The acoustic energy (capacity fraction - L_{wf}) is a function of the TP at the actual operating conditions of the new fan. Therefore, use the TP corresponding to the actual operating conditions in Table II or you will obtain the wrong values of sound power.

SAMPLE CALCULATION

A size 37DW fan must deliver 38,475 CFM ($18.16 \text{ m}^3/\text{s}$) at 6 inches wg (1490 Pa) static pressure. The fan must perform at an altitude of 7000 feet (2134 m) with air entering the fan inlet at 150°F (66°C).

1. DETERMINE THE AERODYNAMIC RATING

The aerodynamic rating is found using the procedures found on page 11 of catalog USC81. The final rating at actual operating conditions are:

38,475 CFM ($18.16 \text{ m}^3/\text{s}$), 6 inches wg SP (1490 Pa), 1329 RPM, 46.7 HP (34.82 kW).

2. DETERMINE THE VP/SP RATIO

From page 43 of catalog USC81, the inlet velocity may be calculated using the inlet area at the top of the page. The inlet area is 16.60 sq. ft. (1.542 m^2).

$$\text{Inlet velocity} = \frac{38475 \text{ CFM} (18.16 \text{ m}^3/\text{s})}{16.6 \text{ sq. ft.} (1.542 \text{ m}^2)}$$

$$= 2318 \text{ FPM} (11.78 \text{ m/s})$$

From Table I for 2318 ft./min., the Velocity Pressure is .33 inches wg., by interpolation, for standard air density. For conditions other than standard, Velocity Pressure must be converted by the same factor as Static Pressure in the example on page 11 of USC81.

$$VP = \frac{.33 \text{ inches wg.}}{15} = 22 \text{ inches wg.}$$

Then for a Static Pressure of 6 inches wg. the VP/SP ratio is .04.

3. DETERMINE THE CAPACITY FRACTION (L_{wf})

The Capacity Fraction (L_{wf}) is given in Table II as a function of air flow (CFM) and Total Pressure (inches). Total Pressure is the sum of Velocity Pressure and Static Pressure, or 6.22 inches wg. By interpolation in Table II between 30,000 and 50,000 CFM, and 6 and 6.5 inches wg. Total Pressure, 38,475 CFM at 6.22 inches wg. has a Capacity Fraction of 62 dB.

4. DETERMINE THE SPECIFIC SOUND POWER (L_{wki}) FOR THE FAN SIZE AND SPEED DESIRED.

The size 37DW fan will run at 1329 RPM and operate at a VP/SP ratio of .04. For the nearest VP/SP and interpolating for speed in the Sound Power Table determine the values of L_{wki} .

For a speed of 1329 RPM and a VP/SP ratio of .05, the values of L_{wki} are:

OCTAVE BAND								
	1	2	3	4	5	6	7	8
L_{wki_B}	41	35	41	33	29	24	18	13
-ERC	4	-2	0	0	0	0	0	0
L_{wki_L}	37	33	41	33	29	24	18	13
(B = Base Fan L = Larger Fan)								

5. DETERMINE INLET SOUND POWER LEVELS (L_{wi}) dB RE 10^{-12} Watts

OCTAVE BAND
